

Automatic BANDSAWS

BS-250HAS

INSTRUCTION MANUAL

MEGA MACHINE CO., LTD.

DOC NO : BS250HAS-100.U

CTRL NO : 06

UPDATE : 1998/7/23

DOC VER : A2

FOREWORD

We hope that the owner of this heavy-duty bandsawing machine will have years of trouble-free service. The machine has been built to the highest standards to enable fast accurate cutting to be obtained.

In order that the best results can be achieved from your MEGA band saw we would ask all operators and maintenance engineers to READ THIS MANUAL CAREFULLY BEFORE STARTING UP THE MACHINE. The manual contains full instructions on installation, operation, lubrication, maintenance and trouble-shooting.

As MEGA MACHINE COMPANY LIMITED is constantly improving the design of its machines, there may be some instance where this book differs somewhat from the machine with which you are concerned. So, always quote the Serial Number of your machine, when ordering spare parts or in correspondence relating to the machine.

MODEL : BS250HAS

Serial Number :

Request for service and spare parts should be made to :

Shipping Volume	(Mm)	2040*2012*1500		
	(Ft)	6.7L*6.6w*5.0H		
Weight Net/Gross	KG, lb	1380 KG / 1610 lb.	3036 KG / 3542 lb.	

Specifications subject to change without notice for improvement and modification.

2.2 STANDARD ACCESSORIES

1. Tools with tool box 1 set
2. 7 ft.(2M) long roller table 1 set
3. Band-cleaning wire brush 1 pieces
4. Band saw blade 1 piece
5. Vertical guide rollers 1 set
6. Instruction manual 1 copy

3. INSTALLATION :

3.1 Moving and Lifting :

Unpack your machine carefully , and use a crane or forklift to set it in position.

If a crane is used to lift the machine attach the lifting cable carefully to the machine as shown in the fig 2. If forklift is used then fig 3.

Sufficient space should be left around the machine to allow safe handling of materials , and inspection and maintenance operation. Should there be other machinery causing vibration or dust near your machine precautions must be taken to keep your machine free of vibration and dust.

(1) Use Crane :

Fig 2

(2) Use Forklift :

Fig 3

3.2 Foundation layout and set-up :

3.2.1 Foundation :

The foundation should be constructed of reinforced concrete and must be level and flat. After the proper leveling position has been obtained , anchor the machine with anchor bolts.

The position of anchor bolts and floor dimensions are shown in fig 4:

Contact portion with floor

Position of anchor bolts

Fig. 4

All leveling bolts should support the weight of the machine evenly .

3.2.2 Leveling :

The production accuracy of all precision machinery depends on the accuracy which the machine is installed . Manufacturing tolerance of the machine can only be guaranteed if the machine is firmly and properly installed . Once the machine is lowered on the prepared foundation . Machinist levels should be used alternately on the vice slide plates and the work feed table , and adjust the left-and-right and fore-and-aft level of the machine with leveling bolt .

Leveling as fig 5 below :

FIG 5

The fore-and-aft level should be adjusted so that the level of the rear end is approximately 10 mm (3/8" - 1/2") higher than the level of the front end , to provide proper return of the cutting fluid , and easy operation of car feeding .

The left-and-right level should be adjusted so that the level of the left end is approximately 3 mm (1/8") higher than the level of the right end , to provide proper return of the cutting fluid , After the proper leveling position has been obtained anchor the machine with anchor bolts .

Caution : All leveling bolts should support the weight of the machine evenly .

3.2.3 Cleaning and oiling :

After the machine has been placed in position , thoroughly remove its rust preventive coating using a suitable cleaning solvent and then apply a coat of machine oil . To clean the machine , Kerosene is preferable to gasoline . It does not evaporate and level dried slushy compound on finished surfaces. Rags are better than waste as they leave no lint or strings. The machine as received by you. has been completely drained of all oil. Before any attempt is made to run it Before any motor connections are made every detail of the following oiling instruction must be complied with. Refer to the oiling chart in chapter 7.

Especially , don't forget to fill up the cutting fluid mixture. Usually , the ratio of cutting fluid to Water should be 1:30 - 1:50. Check the sight gauge to ascertain the fluid level in the tank every day.

Transmission gear box, bar feed gear box, hydraulic oil tank should to topped up monthly. Oil levels should be strictly observed, for it is of primary importance for proper operation and long lift .

3.2.4 Power Source Connection :

- A. Power Source - This machine is equipped with **3HP main motor** and **1HP hydraulic motor** , and **1/8HP coolant motor**. Connect the power supply cable to the circuit breaker(N.F.B.) terminals. The power supply to your machine should agree with the wring voltage that is indicated on the label attached to the electrical enclosure and main motor.

- B. Earth - Be sure to connect the earth cable to the earth terminal.

- C. Starting - After making the necessary wiring connections, turn the power switch on the control panel clockwise to turn power on, depress the vice limit switch (if necessary, e.g. if there is no stock bar clamped in the vice) and push the button to see if the saw head moves upward. If the saw head does not rise , the hydraulic pump motor is rotating in the wrong direction. If the motor runs in the wrong direction, turn off the power switch and disconnect the power supply cable, Then interchange any two phase connections.

4. OPERATION (Type 1)

4.1 Control Panel

(1) PNC Control Panel

Cutting Piece Counter – This counter is used to preset the number of cuts required on the automatic operation. When the counter reaches the preset number, the machine stops automatically. To activate the counter, preset the counter switch with number at least “1”.

Clear – This key is used to clear the counted number cut already and to have new number input available.

Multiple stroke feed counter – This

counter makes it possible to multiply the number of index cycles when off-cut pieces longer than 500mm are required. Maximum 9-time stroke can be set.

Blade speed LED-Display -- This blade speed tachometer indicates how fast the saw blade is running in meter per minute by LED display.

To see digital cut length counter

$$S = \frac{L (\text{length req.}) + K (\text{blade thickness})}{N (\text{multiple feed times})} - K$$

EXAMPLE:

$$S = \frac{1200 + 1.5}{3} - 1.5 = 400.5 - 1.5 = 399$$

L = Required cut length	N = Multiple feeding times
K = Cutting loss (Blade thickness)	S = Digital counter length setting

Total bar feed needed = length + blade thickness

Single step feed = length + K

Multiple step feed only needs 1 allowance for blade

Thickness ...hence...L + K divided by number of steps

Then less K = Digital counter setting length....

(2) **PILOT LAMP** -- This light will come on when the power supply is on.

(3) **EMERGENCY STOP** -- This switch is used for emergency case to stop the machine only.

Turn this switch clockwise makes power source on. When this switch is pressed, all machine's operation stop immediately.

(4) **HYDRAULIC "ON" BUTTON** -- When this button is depressed, the hydraulic pump motor operates.

(5) **POWER SWITCH OFF** -- This switch is used for turning off the power by depressing it.

(6) **FRONT INCHING OPEN SWITCH** -- depress switch No.6 for inching opening of the front vise jaw.

(7) **AUTO - MANUAL SELECTOR** -- For continuous cutting, turn this selector to left "AUTO".

To individually operate each function, turn this switch to right "manual".

(8) **FRONT VISE SWITCH** -- This switch control the front vise jaws in manual mode, switch it to the left makes the front vise in open mode, depress switch No.6 for inching opening of the front vise jaw, and switched to the right makes the front vise clamp.

(9) **BLADE DRIVE BUTTON** -- When this button is pressed, both the saw blade motor and the cutting fluid pump operate and saw head begins to descend. The saw head descends quickly until the feeler of the quick approach device comes into contact with the workpiece and thereafter, it will descend at the designated cutting speed.

(10) **REAR VISE SWITCH** -- This switch control the rear vise jaws in manual mode, switched to the left makes the front vise open. and switched to the right makes the front vise clamp.

(11) **MANUAL FEED FORWARD BUTTON** --When this button is pressed the workpiece moves forward. The workpiece stops advancing when the button is released.

NOTE: Turn (8) **VISE SWITCH** right position before depress switch (9) **BLADE DRIVE** to cutting.

(12) **MANUAL FEED BACKWARD BUTTON** --When this button is pressed the workpiece moves backward. The workpiece stops moving when the button is released.

NOTE: Don't depress (11) and (12) two switches, if the workpiece are clamped by both front and rear vises in the meantime.

(13) **QUICK APPROACH BUTTON** -- While this button is pressed, the saw head descends quickly. This button is used to cause the saw blade to approach the work quickly when the saw blade is at a distance from the workpiece. When the feeler of the quick approach device comes into contact with the work, the saw head stops descending at that position even this button is still pressed.

(14) **SAW FRAME RAISE BUTTON** -- When this button is pressed, the saw blade motor stops and the saw head ascends. The saw head stops ascending at that position when the button is released.

(15) **WORK BEAM LIGHT SWITCH** -- When this switch is set at "1" the work light illuminates.

(16) **AUTO CHIP CONVEYOR & COOLANT SWITCH** -- When this switch is set at "1" the cutting fluid pump operates and cutting fluid will be injected even though the saw blade motor is not in operation. Use this switch when removing saw chips with the cutting fluid (without the blade running).

(17). **INVERTER CONTROL KNOB** -- **Please turn left for being slow speed wanted, turn right for being fast speed wanted.** Please refer to (JPS) Inverter Instruction Manual or Please refer to (TOSHIBA)

Inverter Instruction Manual

(18) **FEED RATE CONTROL KNOB** -- When this control dial is turned clockwise the feed rate of the cutting increases, when it is turned counter clockwise, the feed rate decreases.

(19) **CUTTING PRESSURE CONTROL KNOB** -- When this control dial is turned clockwise the cutting pressure increases, when it is turned count clockwise, the cutting pressure decreases.

4. OPERATION (Type 2)

4.1 Control Panel

(1) PNC Control Panel

Cutting Piece Counter – This counter is used to preset the number of cuts required on the automatic operation. When the counter reaches the preset number, the machine stops automatically . To activate the counter, preset the counter switch with number at least “1”.

Clear – This key is used to clear the counted number cut already and to have new number input available.

Multiple stroke feed counter – This counter makes it possible to multiply the number of index cycles when off-cut pieces longer than 500mm are required. Maximum 9-time stroke can be set.

Blade speed LED-Display -- This blade speed tachometer indicates how fast the saw blade is running in meter per minute by LED display.

To see digital cut length counter

$$S = \frac{L \text{ (length req.)} + K \text{ (blade thickness)}}{N \text{ (multiple feed times)}} - K$$

EXAMPLE:

$$S = \frac{1200 + 1.5}{3} - 1.5 = 400.5 - 1.5 = 399$$

L = Required cut length	N = Multiple feeding times
K = Cutting loss (Blade thickness)	S = Digital counter length setting

- (2) **PILOT LAMP** -- This light will come on when the power supply is on.
- (3) **EMERGENCY STOP** -- This switch is used for emergency case to stop the machine only.
Turn this switch clockwise makes power source on. When this switch is pressed, all machine's operation stop immediately.
- (4) **POWER SWITCH ON** -- This switch is used for turning on the power by depressing it.
- (5) **POWER SWITCH OFF** -- This switch is used for turning off the power by depressing it.
- (6) **HYDRAULIC "ON" BUTTON** -- When this button is depressed, the hydraulic pump motor operates.
- (7) **BLADE DRIVE BUTTON** -- When this button is pressed, both the saw blade motor and the cutting fluid pump operate and saw head begins to descend. The saw head descends quickly until the feeler of the quick approach device comes into contact with the workpiece and thereafter, it will descend at the designated cutting speed.
- (8) **FRONT VISE SWITCH** -- This switch control the front vise jaws in manual mode, switch it to the left makes the front vise in open mode, depress switch No.9 for inching opening of the front vise jaw, and switched to the right makes the front vise clamp.
- (9) **FRONT INCHING OPEN SWITCH** -- depress switch No.9 for inching opening of the front vise jaw.
- (10) **REAR VISE SWITCH** -- This switch control the rear vise jaws in manual mode, switched to the left makes the front vise open. and switched to the right makes the front vise clamp.
- (11) **AUTO - MANUAL SELECTOR** -- For continuous cutting , turn this selector to left "AUTO".
To individually operate each function, turn this switch to right "manual".
- (12) **MANUAL FEED FORWARD** --When this button is pressed the workpiece moves forward.
The workpiece stops advancing when the button is released.
NOTE: Turn (8) VISE SWITCH right position before depress switch (7) BLADE DRIVE to cutting.
- (13) **MANUAL FEED BACKWARD** --When this button is pressed the workpiece moves backward.
The workpiece stops moving when the button is released.
NOTE: Don't depress (12) and (13) two switches, if the workpiece are clamped by both front and rear vises in the meantime.
- (14) **QUICK APPROACH BUTTON** -- While this button is pressed, the saw head descends quickly.
This button is used to cause the saw blade to approach the work quickly when the saw blade is at a distance from the workpiece. When the feeler of the quick approach device comes into contact with the work, the saw head stops descending at that position even this button is still pressed.
- (15) **SAW FRAME RAISE BUTTON** -- When this button is pressed, the saw blade motor stops and the saw head ascends. The saw head stops ascending at that position when the button is released.
- (16) **WORK BEAM LIGHT SWITCH** -- When this switch is set at "1" the work light illuminates.
- (17) **AUTO CHIP CONVEYOR & COOLANT SWITCH** -- When this switch is set at "1" the cutting fluid pump operates and cutting fluid will be injected even though the saw blade motor is not in operation.
Use this switch when removing saw chips with the cutting fluid (without the blade running).
- (18) **CUTTING PRESSURE CONTROL KNOB** -- When this control dial is turned clockwise the cutting pressure increases, when it is turned count clockwise, the cutting pressure decreases.
- (19) **FEED RATE CONTROL KNOB** -- When this control dial is turned clockwise the feed rate of the cutting increases, when it is turned counter clockwise, the feed rate decreases.

4.2 OPERATING PREPARATION

There are several steps will be taken before start the machine.

(1) CHOOSE PROPER SAW BLADE :

Select the saw blade best suited to the workpiece to be cut, Size and shape of the workpiece , and type of material should all be considered when selecting the saw blade to be used . There is a reference chart in chapter 7 which can help you to select the right saw blade and cutting conditions .

(2) UNPACK THE SAW BLADE :

Usually the saw blade is packed in 3 circle ,unpack it one circle first grip the part to release another 2 circles gradually , tear off the saw-cap protective shield , inspect the blade teeth , make sure that the cutting edge of the blade teeth point to the right . If they point to the left the blade should be turned over.

(3) PLACE THE SAW BLADE ONTO BOTH THE DRIVE AND DRIVEN WHEELS ----

- a. Turn the hydraulic blade tension handle clockwise , to fully loosen the driven wheel .
- b. Open both the drive and driven wheel covers , place the saw blade onto both the drive and driven wheels. Check the cutting edge of the saw blade , to ensure that it point to the right.
- c. Insert the saw blade into both the left and right blade guides so that the back edge of the saw blade touches the back-up roller of each guide .
- d. The back edge of the saw blade should make contact with the flange of the drive and driven wheel , turn count -clockwise the hydraulic blade tension handle to tighten the saw blade , Then the blade is properly tensioned .
- e. Don't forget to tighten the insert adjusting screw .

(4) WORKPIECE CLAMPING :

- a. Raise the saw frame , open the vise , place the workpiece on the roller table .
- b. Gently push the workpiece into the roller-feed vise, taking care not hit the feed rollers.
- c. Clamp the workpiece in vise.

(5) ADJUST THE BLADE GUIDE ARMS :

Properly position the blade guide arms according to the diameter (or the width) of the workpiece to be cut.

- a. loosen the insert adjusting screw.
- b. loosen the lock lever of the blade guide arm, and manually move the blade guide arm to suit the width of material using the scale provided.
- c. After adjusting the blade guide arm position ,tighten the lock lever.
 - d. Finger tighten the insert adjusting screw.

(6) ADJUST THE POSITION OF THE WIRE BRUSH :

- a. loosen the lock lever of the wire brush case.
- b. Manually move the wire brush case so that wire brush just contacts the cutting edge of the saw blade.
- c. Tighten the lock lever.

(7) ADJUST THE FEED RATE :

Select suitable feed rate for the workpiece to be cut. This varies according to the size and shape of the workpiece, type of material , and what type of saw blade is being used. As a guide hard materias, wide workpiece or structural sections and tubing have to be cut at a slower rate that mild steel bar. As concerns the saw blade , high speed steel is better than carbon steel, and bi-metal alloy is better than high speed steel. Roughly the ratio of feed speeds could be 1:2:3

(8) CUTTING LENGTH PRESET :

To preset the length of the workpiece to be cut ,use the precise cutting piece counter which is at front leftside of the machine.

- a. Turn the handle wheel and watch the counter to the length you want to cut. The calibration is 0.10 mm.for example: 400.1 mm
- b. Tighten the lock screw.

(9) SELECT THE SAW BLADE SPEED :

There are 6 speeds provided : 25, 32, 42, 55, 70, 80 M/min

If a optional variable speed drive is equipped the speed to be 20 to 80 M/Min steplessly.

4.3 MANUAL OPERATION :

Place the workpiece to be cut on the work table , decide how long you want the off-cut , and carry out all the procedures as described above in [2] Operating Preparation.

- (1) Depress the RAISE button to lift the saw frame until the cutting edge of the saw blade clears the workpiece by 1/2 to 3/4 inch.
- (2) Turn the AUTO-MANUAL selector to manual.
- (3) Clamp the workpiece.
- (4) Adjust the spacing of the blade guide arms.
- (5) Preset the required cutting length of the workpiece.
- (6) Depress BAR FEED PORWARD button until the workpiece touch the bar stop feeler.
- (7) Adjust the FEED RATE.
- (8) Depress BLADE DRIVE button to start both the saw blade motor and the cutting fluid pump and the saw frame begins to descend.
- (9) After completion of the cut saw blade stops at the lower limit position.
- (10) Depress the RAISE button to cut next piece again.

*. Before you start to cut the workpiece, you must inspect that....

*. The workpiece is well clamped.

*. The saw blade is suitable for the material being cut.

*. The feed rate is suitable for the material being cut.

*. The speed of the saw blade is suitable for the material being cut.

*. The insert adjusting screw and the lock lovers of the blade guide arms are all tightened.

*. Sufficient tension is placed on the saw blade.

*. The wire brush is properly positioned.

*. There is sufficient cutting fluid in good condition.

*. The off-cut length is as required.

4.4 AUTOMATIC OPERATION :

Having finished all the procedures described above in (2) Operating Preparation ,and with the workpiece to be cut placed in the vise of the machine , but NOT under the saw blade.

- (1) Turn the AUTO-MANUAL selector to auto.
- (2) Depress the QUICK APPROACH switch to make the saw frame descend quickly to touch the lower limit position , it will then rise automatically to the freight preset.
- (3) Make any necessary adjustments to HEIGHT SELECTOR to ensure that the saw blade clears the material by 1/2 to 3/4 inch then repeat (2) above to check setting.
- (4) Depress BAR FEED FORWARD button until the workpiece touches the bar stop feeler.
- (5) Preset the number of cuts required.
- (6) Depress the BLADE DRIVE button to start both the saw blade motor and the cutting fluid pump. The saw frame begins to descend to cut workpiece.
- (7) After the required number of cut has been completed, the saw frame will lift to the raised position and all machine operation will stop.
- (8) The machine will automatically stop, when the workpiece is so short that it can no longer be automatically feed.

4.5 SPECIAL OPERATION :

- (1) While you are cutting a workpiece, if the saw blade suddenly jams in the workpiece, depress the FRAME RAISE button to lift the saw frame immediately.
- (2) The saw blade jamming in the workpiece is most likely because of :
 - a. Slippage occurring between saw blade and drive wheel. Tension placed on the saw blade is not sufficient.
 - b. Slippage occurring between drive belt and motor pulley. Tension on drive belt is not sufficient or belt is worn.
 - c. Broken teeth on saw blade.
 - d. Too blunt saw blade.
 - e. Too fine tooth spacing on saw blade for material being cut.
 - f. Too fast feed rate for material being cut and blade used.

4.6 BREAK-IN OPERATION:

When a new blade is used , be sure to first break in the blade before using it for extended operation. Failure to break in the blade will shorten the service life of the blade ,and result in less than optimum efficiency. To break in the blade ,proceed as follow :

- (1) Reduce the blade speed setting to one half of its normal setting .
- (2) Lengthen the time required for cutting to 2-3 times that of normal.
- (3) The break-in operation can be considered sufficient if all unusual noises or metallic sounds have been eliminated. (For instance, to completely break in the blade, a minimum of five complete cuts of a 200mm (8 ins) diameter work- piece will be required.)
- (4) After the break-in operation has been completed, return the blade speed and feed rate to their normal setting.

AMPLIFYING VALVE

(1.) THE OUTLINES AND HYDRAULIC CIRCUITS:

A. V.

Path: F:\DWG\H550A\PNC-10.DWG.1

(2.) SET-UP

A. The hydraulic pressure indicated in line <p> should be kept in constant during the whole stroke of the lifting cylinder, i.e. Between the very top and bottom position of the swinging saw frame. we use springs <r> inside of lifting cylinder to balance/compensate the pressure changes (pressure varies due to saw frame swinging up and down) in line <p>. above procedures have been done in our factory before machine dispatched , now for checking test, please dry run the machine by raising the saw frame to the very top position and push the saw blade drive button, and having the quick approach rod lifted (limit switch un-touched), then check the hydraulic pressure in line <p> by reading the pressure gauge at line <p> to see if the pressure readings keep the same during the whole stroke.

(maximum 1 kg/sq.cm varies allowed) the pressure reading should be as follows:

- 8 KG/SQ.CM250HAS/300HAS MODELS
- 10 KG/SQ.CM360HAS/400HAS/450HAS MODELS

B. Re-zeroing knob "a" & "b" on the amplifying valve:

For zeroing knob "a", there is a hydraulic pressure gauge as drawing <S> needed, Please plug it onto the outlet on the amplifying valve.

Pressure read at line <p> as the primary pressure.....pressure <p>

Pressure read at amplifying valve as the secondary pressure.....pressure <s>

The primary pressure should be kept the same reading, and the secondary pressure can be adjusted by turning knob "b" for cutting pressure settings zeroing knob "a" :

Dry run the machine as stated in above paragraph,

Turn knob "b" while reading pressure <s>, If there is any pressure can be read, then turn knob "a" While watching saw frame, if the saw frame shall stand still there without coming down, then there is the zero position of the knob "a" (zero feed-rate), check the " " mark on the knob "a" to see if this mark pointing to "0" position. If not, loosen set screw and zeroing it (Please make sure tighten the set screw after zeroing). zeroing knob "b" :

After zeroing knob "a", turn knob "a" at "5" position, and let the machine running in the same condition as previous did - dry running. turn knob "b" while reading pressure <s>, If the pressure reach 5.5 to 6 kg /sq.cm, then loosen the set screw on the knob "b" and have the " " mark pointing to "5" position and tighten the set screw.

(3.) OPERATION

Knob "a" is for maximum feed-rate setting:

The smaller the diameter of the material being cut, the higher feed-rate.

The softer the material being cut, the higher feed-rate can be set. And vice-versa.

Knob "b" is for cutting pressure setting:

The tougher the material being cut, the higher cutting pressure needed. For instance, when cutting thin pipes/tubes, mild carbon steels, Only little pressure needed, and for stainless/high alloy tool steels or inconel special steels, high cutting pressure should be needed. There are both AISI/JIS material codes shown on the control panel, Please refer to it for proper cutting pressure setting.

LIMITATION: The sum of the number set on knob "a" and "b" can not exceed 10.

5. Maintenance

5.1 Hydraulic Circuit

5.2 Oiling and Lubricant

The operator should be responsible for the proper lubrication of the machine. The grade and quality of lubricant are given in the lubrication chart below :

Oil Lubrication chart

	Lubricating Point	Lubricant	Quantity	Oiling Frequency
1	Blade Tension Device	DAPHNE FLUID 32T	few	Twice a year
2	Driving Wheel Bearing	Grease	few	Thrice a year
3	Guide Slides	DAPHNE FLUID 32T	few	Oil daily
4	Transmission Gear Box	DAPHNE GEAR LUBE 320	3Litres	Twice a year
5	Pivot Shaft	Grease	few	Twice a year
6	Adjusting Slide	DAPHNE FLUID 32T	few	Oil daily
7	Hydraulic Oil Tank	DAPHNE FLUID 32T	40Litres	Twice a year
8	Vise Slides	DAPHNE FLUID 32T	few	Oil daily
9	Cutting Fluid Tank	Cutting Oil Mixture	30Litres	Daily

Belt Size			
NO.	Belt Name	Belt Size	Qty.
10	Motor Belt	50HZ use 3V475& 60HZ use 3V450 Inverter use 3V450	1
11	Wire Brush Belt	M43	1

5.3 Others

VARIABLES WHICH AFFECT BANDSAW BLADE LIFE

- 1 . The Operator - The operator is the most important variable at any test. He can make or break any test and often has a great deal of influence over whose bandsaw blades are used. He can also be a good source of information on what is going on, competitive situations, relationships with manufacturers or distributors, etc. Don't ignore the operator.
- 2 . Number of Teeth in the Band - There should always be a minimum of three teeth in the work at all times to avoid straddling. Nine to twelve is the optimum number and anything over 24 is probably too high (although sometimes unavoidable).
- 3 . Tooth Style - Standard, skip, sabre , Si -Pitch or XL. The best tooth style for the material being cut should be used.
- 4 . Tooth Set - Regular, Wavy, E.T.S., Si - Pitch, Maxi -Sharp. The proper band with the proper set for the material being cut should be used.
- 5 . Band Tension - Band tension, as measured by Simonds Patented Simometer, is important to the efficient running of a bandsaw blade. Too little tension can cause a blade to "wander" in the cut while too much can actually pull the band apart.
- 6 . Band Speed - Start with Simonde speed and feed slide chart. Too high a speed can cause too much heat lessening the life of the band. Too low a speed could cause overfeeding. Always reduce the speed when cutting dry.
- 7 . Break - in Procedure - The normal feed rate should be reduced to about 1/2 for the first 50 square inches or so to hone in the blade. A good example is that of a sharp pencil. You must not bear down hard on it right away or you risk breaking the point. The same holds true for a bandsaw tooth.
- 8 . Feed Rate - Set the feed rate by square inches per minute according to simonds speed and feed slide chart. Watch your chips and adjust accordingly as both overfeeding and underfeeding cut bandsaw life.
- 9 . Band Quality - Carbon steel blades vs. High Speed Blades, M-2 vs. M42, etc. All affect the life you will get from the band. Once again choose the proper type band for the job. There are also differences in quality among manufacturers. Simonds has some of the highest quality standards in the world.
- 10 . Machine Type - Different makes and models with varying horsepower available can affect life. A well made heavy duty machine can greatly enhance band life.
- 11 . Wheels - The Wheels carry the band and it is very important that they be properly aligned and that the bearings be in good shape. Misaligned wheels and loose bearings can cause undue stresses on the band and reduce fatigue life. Flanges should also be checked and if extremely worn, the wheel should be replaced. Worn flanges are usually a sign of misalignment or bad bearings.

12. Machine Condition-Whether a machine is old or new, and whether well maintained or not contributes to how well it runs and how long the band last. The better shape a machine is in, the better the bands will run. Poor machines ruin bandsaw blades.
13. Proper Vices - The work must be properly held. Side vices and top vices, if necessary, should be in good shape and able to firmly hold the work. Anything that moves will strip teeth.
14. Guides - The guides must support the band well while in the cut. The guides in conjunction with tension are all that keeps the band straight. Roller guides should be snug against the band and turn freely. The surface should be flat and not worn at an angle. Solid carbide guides should also be snug against the band and should show no sign of wear. They can be faced off if necessary. Backup guides should not be grooved and should also turn freely if rollers. Be sure the teeth of the band do not ride up into the guides.
15. Guide Arms - The guide arms should be as close to the work as possible. Beam strength is determined by a cubed factor, so increasing the distance between the guides by a factor of 2 decreases the beam strength by a factor of $(2)^3$ or 8. You lose a lot very quickly.
16. Brushes - A good set of brushes (powered is preferable) aid in the cleaning of chips from the gullets, if available and properly adjusted. One test shows a better than 25 % increase in life just by using brushes. Always check the brushes.
17. Coolant - A good coolant will help cool, lubricate and wash the bandsaw blades. Always maintain a good flood of coolant when possible.
18. Material machinability - The tougher the material, the less expected band life. For instance 1018 vs. Inconel 718.
19. Material Hardness - A Rockwell C scale reading of 40 is approaching a machinability of 0. Only recently have we been able to go much beyond this with the introduction of our CT Type III band.
20. Material Shape - Structural and small solids are always harder on a band than large solids.
21. Production Requirement - Continuous runs of one size and material is easier than intermittent cutting of various sizes, shapes and materials.
22. Room Temperature - Temperature has a big effect on the hydraulic system of a machine. Always allow the machine to warm up before starting to saw.

6. TROUBLE SHOOTING GUIDE

The following charts contains some typical troubles along with the probable causes and remedies for each.

6.1 Sawing Problems and Solution

Vibration during cutting						
Failure to cut						
Short life of saw blade						
Curved cutting						
Broken blade						
					Use of blade with incorrect pitch	Use blade with correct pitch , suited to workpiece
					Failure to break-in saw blade	Perform break-in operation
					Excessive saw blade speed	Reduce speed
					Insufficient saw blade speed	Increase speed
					Excessive load	Reduce feed rate
					Insufficient load	Increase feed rate
					Insufficient saw blade tension	Increase tension
					Wire brush not working correctly	Relocate or replace
					Blade improperly guided by insert	Check and correct
					Improperly clamped workpiece	Check and correct
					Excessively hard material surface	Soften material surface
					Excessive cutting rate	Reduce cutting rate
					Non-annealed workpiece	Replace with suitable workpiece
					Insufficient or lean cutting fluid	Add fluid or replace
					Vibration near machine	Relocate machine
					Non-water soluble cutting fluid used	Replace
					Air in lift cylinder	Bleed air
					Broken back-up roller	Replace
					Use of non-specified saw blade	Replace
					Fluctuation of line voltage	Stabilize
					Adjustable blade guide arm too far from workpiece	Bring blade guide arm close to workpiece
					Loose blade guide	Tighten
					Blue or purple saw chips	Reduce cutting rate
					Accumulation of chips at inserts	Clean
					Reverse positioning of blade on machine	Re-install
					Workpiece not bundled properly	Re-bundle
					Back edge of blade too hard against flange	Adjust wheel so that blade is just firmly against flange
					Workpiece of insufficient dia.	Use other machine, suited for diameter of workpiece
					Saw blade teeth worn	Replace

6.2 Minor Operating Troubles and Remedies

Symptom	Probable Cause	Remedy
1. Buttons do not function	(1) Power disconnected (2) Circuit protector OFF (3) Thermal relay activated (4) Safety interlocks that is <ol style="list-style-type: none"> a. No workpiece is clamped in the vice. b. The saw frame is not fully raised to the height preset. c. The saw frame is raised too high so that the upper limit switch has been touched 	(1) Connect (2) Turn on (3) Push reset button <ol style="list-style-type: none"> a. Load workpiece b. Depress FRAME RAISE button c. Depress QUICK APPROACH switch
2. The saw frame descends out of sequence	(1) Solenoid valve blocked. (2) Piping leakage (3) Packings , O-Rings of cylinder worn or torn	(1) Disassemble the valve and clean thoroughly. (2) Inspect hydraulic piping (3) Replace
3. Short service life of wire brush	(1) Wire brush too heavily in contact with saw blade.	(1) Re-position the wire brush.
4. Bubbles out of fluid taps	(1) The cutting fluid is not sufficient (2) The filter clogged by swarf	(1) fill up take. (2) Clean the tank and filter.

6.3. Error information

The following table contains some typical errors along with the error details and remedies.

AH237 Bandsaws Trouble shooting guide

Code	Error details	Turn manual to manual
00	Normal Machine Stop	
01	Frame raise time over	Reset
02	Frame raise position L/S out of order	Detect and replace
03	Barfeed front /rear position L/S out of order	Detect and replace
04	Feed forward solenoid out of order	Detect and replace
05	Out of material	
06	Saw frame quick down against lower limit	Lift saw frame again
07	Idle wheel sensor out of order	Detect and replace
10	Upper limit switch error	
11	Front limit switch out of order	Detect and replace
12	Backward limit switch out of order	Detect and replace
13	Rear limit switch out of order	
14	Inverter tripped	Power off
15	Inverter out of order	Call to agent
16	Hydraulic magnetic contactor out of order	Detect and replace
17	Hydraulic motor over load	Power off and call to agent
20	Coolant pump magnetic contactor out of order	Call to agent
21	Coolant pump motor over load	Call to agent
22	Blade start button out of order	Call to agent
23	Blade down button out of order	Call to agent
24	Feed forward button out of order	Call to agent
25	Feed backward button out of order	Call to agent
26	Vise open/clamp button out of order	Call to agent
30	Piece counter number reached	1.Lift saw frame again 2.Press to the CLEAR key
31	Saw frame raise button out of order	Call to agent
32	Piece counter number reached no reset	1.Lift saw frame again 2.Press to the CLEAR key
33	Wheel and Pulley cover no close	Lift saw frame
34	Blade clamp no action	Lift saw frame
35	Blade clamp in action	Lift saw frame

SUS-32	3M	27.40	8-20	10000-20000

NOTE:

- (1) All conditions described above are based on the use of high speed steel saw blade.
- (2) The workpiece is 150 mm round and solid, normalized heat treatment, and there are no hard spots in the material.
- (3) The cutting surface concave or convex by 1.0mm is permitted.
- (4) The indicated service life of a saw blade stated is based on an average value spread over results from 10 saw blades.
- (5) The selection of a correct blade for any one type and size of material being sawn is largely dependent upon trial and error until the desired conditions are fulfilled, i.e. finish cutting time, blade life, etc. However these charts are offered here for the guidance of users so that these conditions may be obtained.

7.2 Standard Cutting Chart
